

CLOTHES MANAGEMENT SYSTEM

OODP Project
22/4/2026

BY GROUP 13

THE REASON (*PAIN POINTS*)

01/ The Blind Spot

Modern wardrobes harbor digital invisibility. Up to 40% of collections remain untouched due to lack of visual indexing

03/ Creative Inertia

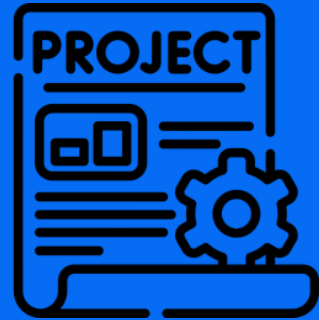

We retreat to “safety cycles,” wearing only 20% of our inventory. Potential style remains locked in physical clutter.

02 / Maintenance Lag

The "morning rush" is stalled by invisible maintenance cycles. Is it clean? The question shouldn't exist.

04 / Redundant Inflow

Without an active index, we acquire duplicates. Financial and spatial capital is wasted on what we already own.

PROJECT'S BACKGROUND

Wardrobe Manager is a Java console application that helps users organize and manage their clothing items. Many people forget what they own or struggle to choose outfits. This project solves that by letting users store clothing details, track usage, and get outfit suggestions. It also reminds users when clothes need washing based on how often they are worn.
